

Análise comparativa da representação das características elétricas das redes de distribuição no cálculo das Perdas Técnicas Regulatórias

Grupo 6:

Eleandro Marques – CERTAJA

Júlio Arilon de Bitencourt – JPEnergy Consultoria

Professor: Paulo Radatz

Objetivo

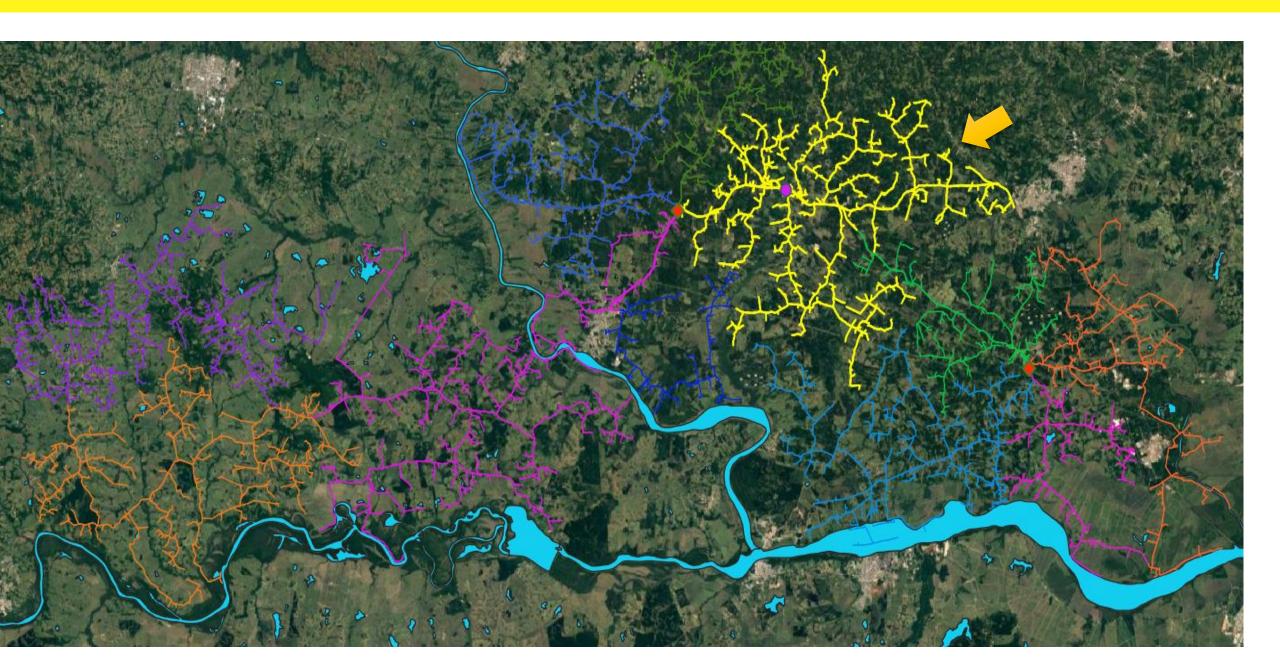

Análise comparativa entre a utilização das características elétricas das redes de distribuição nos segmentos de média tensão (SDMT) e baixa tensão (SDBT) aplicando-se:

- 1) os modelos de representação de linhas através do emprego dos parâmetros de impedância de sequência positiva (R1 e X1), adotados atualmente pela SRD/ANEEL no cálculo das perdas técnicas regulatórias e
- o modelo de linhas através da geometria dos cabos considerando os padrões de redes de distribuição aérea

Metodologia

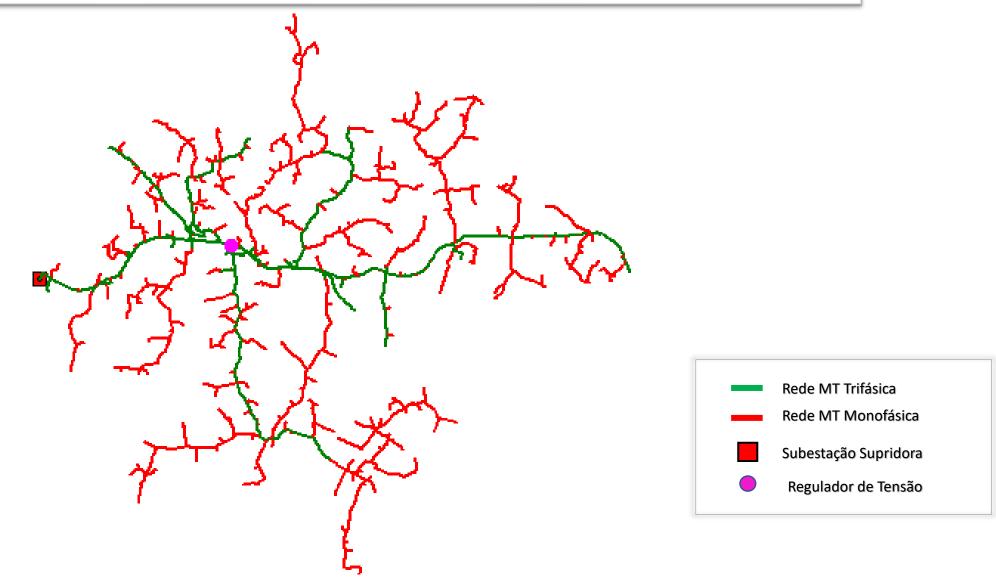

- ➤ Será utilizado o OpenDSS para realizar o fluxo de potência no modo dinâmico e computar as perdas técnicas nas redes de Média (MT) e Baixa Tensão (BT), bem como as perdas nos transformadores MT/BT utilizando-se a programação em Python para controlar a execução do OpenDSS no modo DLL (biblioteca Py-DSS-Interface).
- ➤ Modelagem das cargas MT e BT: critérios utilizados pela ANEEL, 50% com potência constante e 50% com impedância constante, respeitando os limites mínimos de tensão de 0,92 pu para as cargas BT e 0,93 pu para as cargas MT.
- > curvas de cargas típicas e para isto será utilizado o recurso "loadshape" do OpenDSS.

Geometria das Redes Média Tensão Cabo Nu

- Para o trabalho, as informações de espaçamentos das estruturas, foram extraídas diretamente do banco de dados da distribuidora com o objetivo de se obter fidelidade nas informações no estudo;
- Para extração diretamente do BDGD, como essa informação não é disponibilizada, é possível realizar generalizações através das SSDMT, SSDBT PONNOT e "SEGCON", relacionando as diversas informações sobre as mesmas.

Resultados das Perdas Técnicas

- > Pequena variação percentual das perdas técnicas
- ➤ Perdas técnicas regulatória 8,203%
- ➤ Perdas técnicas com geometria dos condutores: 8,283%
- ➤ Pequena elevação das perdas técnicas considerando a geometria dos condutores comparada com as premissas da ANEEL em empregar as impedâncias de sequência positiva R1, e X1
- ➤ a modelagem dos parâmetros de linhas através da geometria dos condutores representa melhor o modelo físico das impedâncias das redes de MT e BT, desta forma, permitindo o cálculo mais efetivo das perdas técnicas.
